

Far Flung Forest Landscapes in the Anthropocene

Structural analysis of China's embodied forest network

M.K. Lau (Ph.D.)

OUTLINE

- ▶ Intro/Context
- ▶ Overview: Analyzing Economic and Ecological Systems
- ▶ Landscape Extended Models
- ▶ China's Forested Landscapes and Embodied Trade Networks
- ▶ Resilience Analysis of China's Forest LE-MRIO
- ▶ Conclusions and Future Work
- ▶ Acknowledgements

Motivation

- ✚ Ecological studies are now embedded in the anthropocene
- ✚ Interconnected world
- ✚ Global environmental change
- ✚ Complex systems at global scales

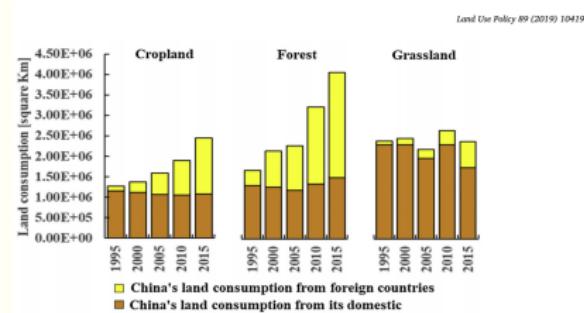

Overview

Background: Anthropocene

- Humans = dominant global impact -> Anthropocene
- Indirect effects and The far reach of the city
- Complex systems = many players and indirect effects matter

A little money moves a lot of forest.

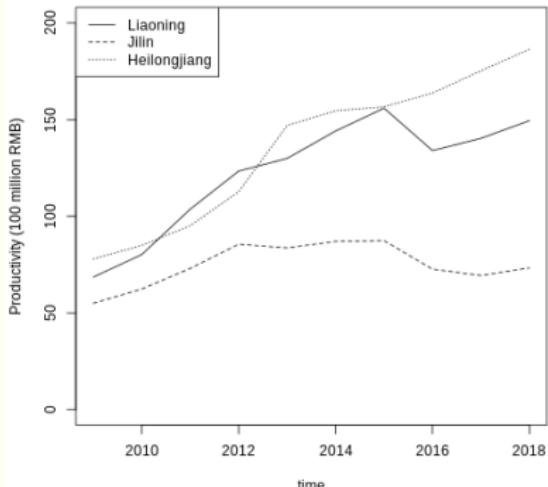

- Tian et al. 2019 showed that China consumes an equivalent amount of domestic cropland as forest land, on the order of 10^6 km^2 .
- Looking at the domestic landuse productivity data for China, forests have the lowest monetary productivity.
- Thus, per unit monetary output a relatively larger amount of forest land is used.

QUANTITATIVE INPUT AND OUTPUT RELATIONS IN THE ECONOMIC SYSTEM OF THE UNITED STATES

INTRODUCTION

The statistical study presented in the following pages may be best defined as an attempt to construct, on the basis of available statistical materials, a *Tableau Economique* of the United States for the year 1919.¹

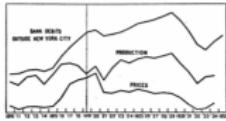

One hundred and fifty years ago, when Quesnay first published his famous schema, his contemporaries and disciples acclaimed it as the greatest "invention" since Newton's laws. The idea of a national income statistic existing among the various parts of the economic system has become by now the very foundation of economic analysis. And yet, when it comes to the practical application of this theoretical tool, modern economists must rely exactly as Quesnay did upon fictitious numerical examples. What would be the present state of the theory and policy of international trade if, instead of actual statistics of foreign trade, the student had to base his analysis upon assumed numerical set-ups, supplemented by scattered items of actual statistical information? This is the situation in which the student of economics finds himself at present when he faces a problem of national production, consumption, and distribution. Despite the remarkable increase in the volume of primary statistical data, the proverbial boxes of theoretical assumptions are in this respect as empty as ever. Considerable progress has been achieved in the field of national income statistics. The economic balance of some of the most important branches of the national economy, particularly

The publication of this preliminary survey is prompted by the conviction that the inevitable path of any empirical research is that of trial and error.

Governmental publications constitute the main source of primary statistical information used in this study. Additional data were gathered from trade publications, and in some instances the results of special investigations have been used. In all cases, use was made of the work of the National Bureau of Economic Research on national income.

At the time that this study was initiated (1932), the publication of the detailed results of the 1929 Census was still far from complete. As a result, the Census of 1919 had to be used. It is because of this fact that the entire investigation is based on 1919 data.

CHART I.—SERIES INDICATIVE OF BUSINESS CONDITIONS

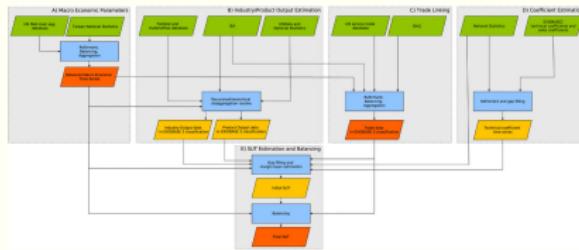

The general business conditions prevailing during that year are described in W. L. Thorp's *Business Annals* in the following terms:

Background: Input-Output Models

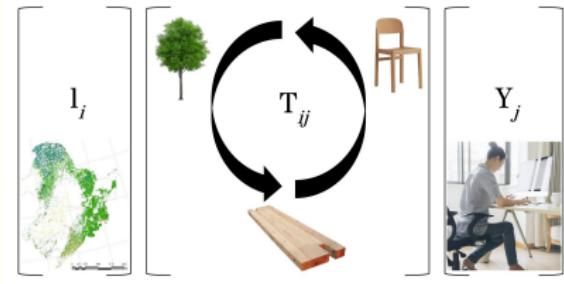

- How do we quantify and manage systems?
- Input-Output Analysis provides a modeling framework
- Direct consumption
- Trade occurs among sectors == Indirect consumption
- IO and MRIO models
- A new equation for a new era in science $E = F(I-A)^{-1}$

Background: Input-Output Models

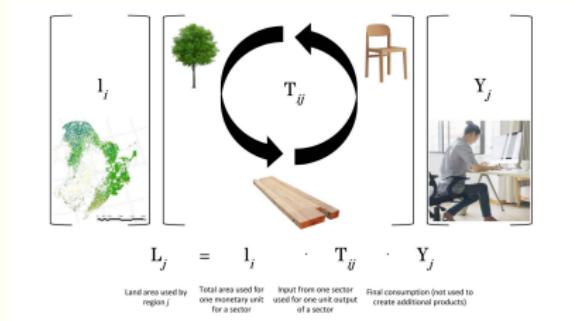

Background: Environmental

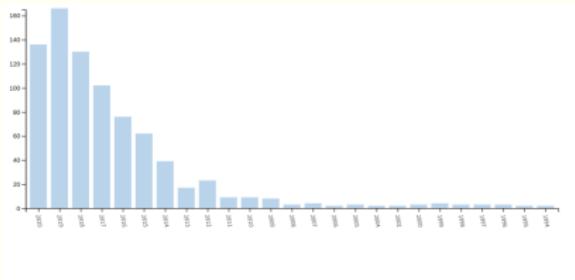

- Allows for indirect/consumption based accounting

Background: Environmental

Background: Networks are

Background: Networks are

Background: Ecological Network

- ✚ Ecological network theory provides predictions and metrics (Lau 2017)
- ✚ Systems theory provides strategies for interventions
- ✚ ENA <- Odums, MacArthur, Ulanowicz, Patten,
- ✚ SNA -> ecological networks (Watts and Strogatz, etc.)
- ✚ Structure linked to function (Donella Meadows)

Which metric?

Why information metrics?

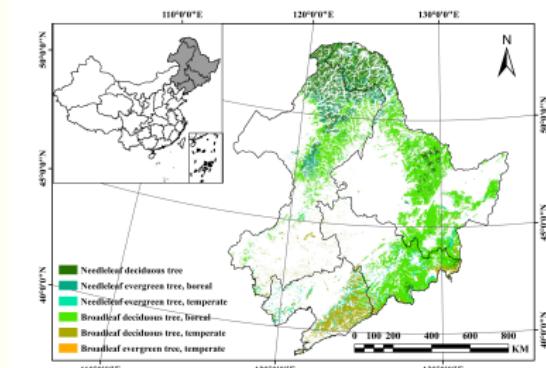

Research: Why Chinese Forests?

- Work = Forest Land Embodied in Trade

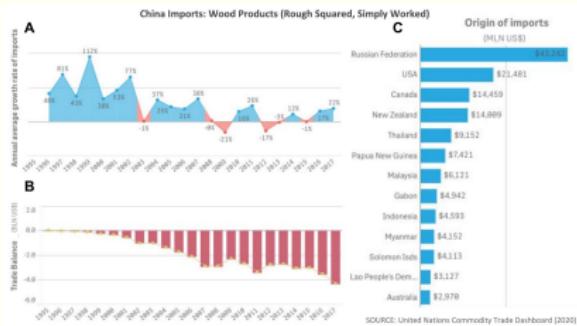

A Brief History of Forest Time in

- China is big and diverse
- Long history of human habitation in China
- Historically, two primary regions of forestry
- Forest conservation impacts harvest
- Flows within China and among countries globally important

Research: Why Chinese Forests?

Research: Why Chinese Forests?

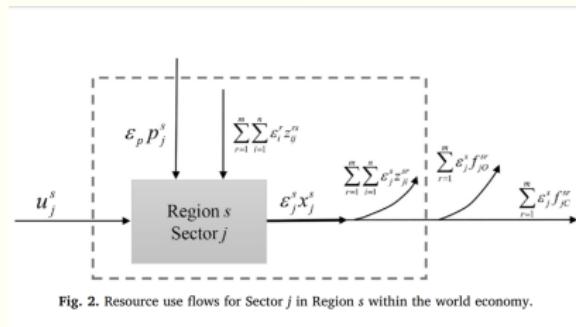

Methods: Model MRIO *China*

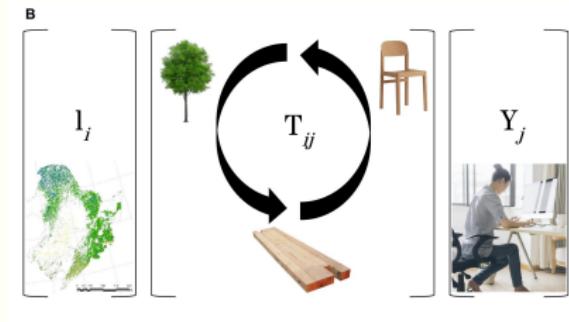

Table 1
The structure of the ecological MRIO account.

Output	Intermediate use								Row of final demand (final goods)	
	Region 1	... <th>Region m</th> <th>Region 1</th> <th>...<th>Region m</th><th>Region 1</th><th>...<th>Region m</th></th><th data-kind="ghost"></th></th>	Region m	Region 1	... <th>Region m</th> <th>Region 1</th> <th>...<th>Region m</th></th> <th data-kind="ghost"></th>	Region m	Region 1	... <th>Region m</th>	Region m	
Inputs	Sector 1	Sector n	Sector 1	Sector n	Sector 1	Sector n	Sector 1	Sector n	Sector 1	Sector n
Primary inputs									f_j^r	
Exogenous environmental inputs										

Methods: Model MRIO_{China}

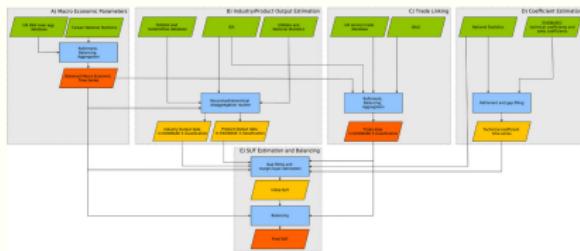

Methods: Environmentally Extended

Main Focus of Research

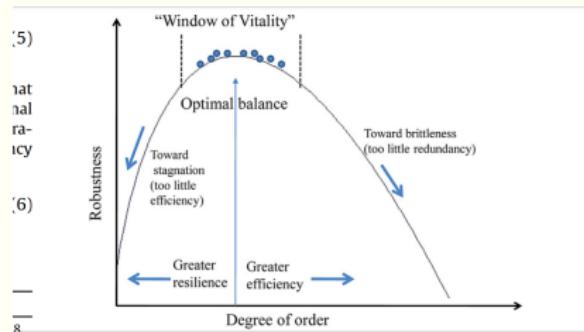

1. What research has been done on forest or forest landscape embodied networks?
2. What is the network structure? How can we characterize it?
3. What can we say about the potential system dynamics based on network structure?

Research: Network Analysis

- ▶ LEMRIO global (Tian 2019)
- ▶ LEMRIO local (Chen 2019)
- ▶ Your LE-MRIO China
- ▶ Your ENA analysis
 - Small world
 - Modularity
 - Centrality
 - Control
 - Resilience

Research: Structural Analysis

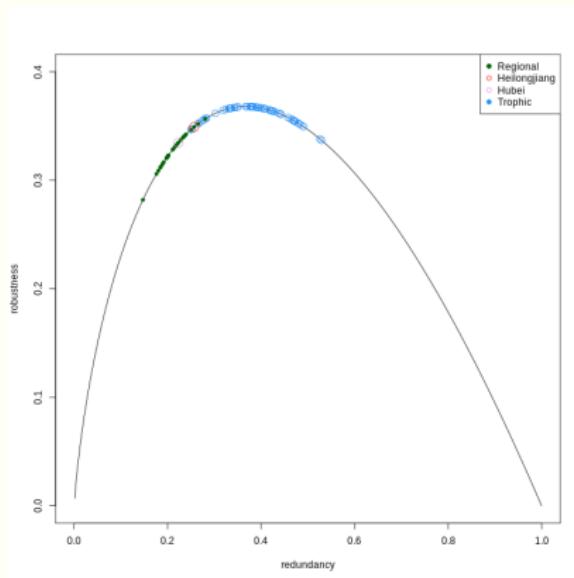

- Analysis = Structure = Robustness

Research: Structural Analysis

- Overly efficient = Brittle
- Overly redundant = Stagnant
- Both can lead to niche openings
- Niches can then be filled by natural selection, adaptation or invasion

Forest Landscape Networks are More Robust

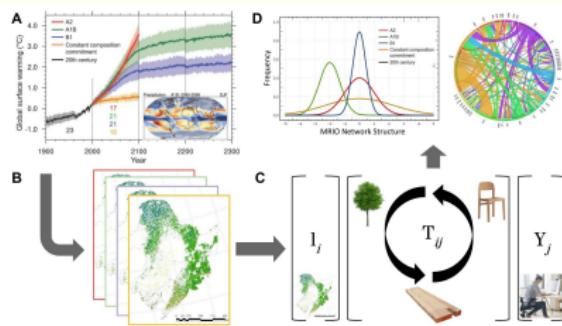

Caveats

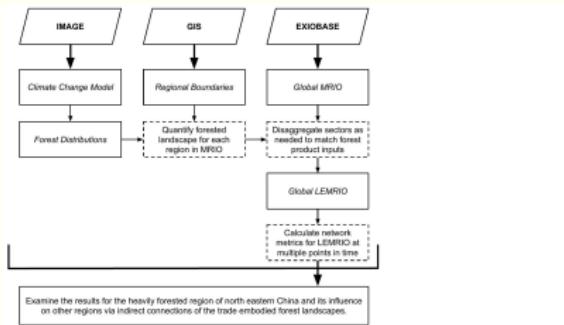

- ▶ Limitations of MRIO
- ▶ Potential impacts of storage lags and buffers

Future: Next up, climate change

- Next up = Climate change impacts and global scale

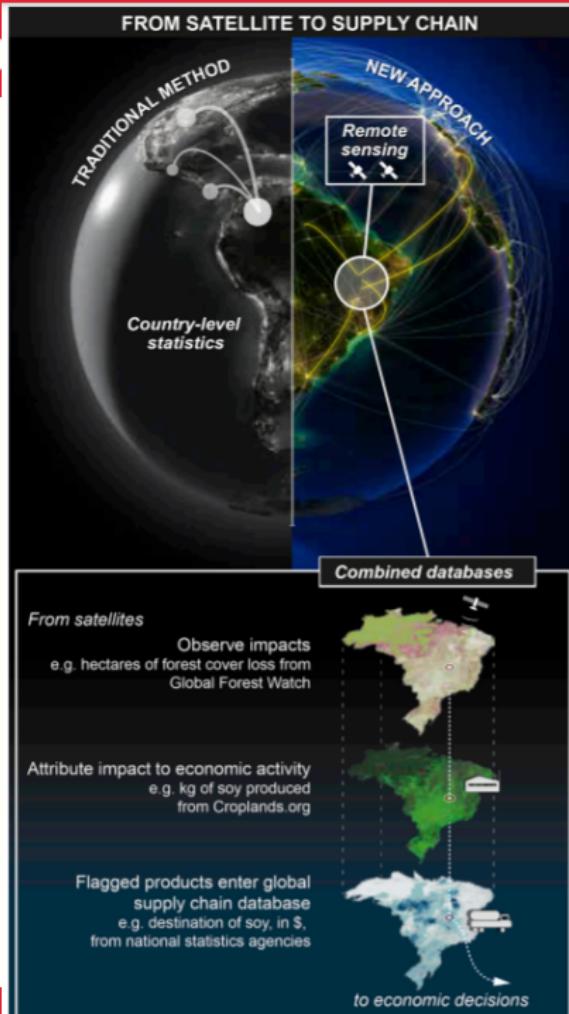

Future: Next up, climate change

Future World Trade

Supply Chain
